Deployment Models & Strategy

Move the right thing,
to the right place,
for the right business reason.

Public | Private | Hybrid | Multi-cloud

Session purpose

Decide

where workloads should run

Balance

speed, control, risk

Apply

deployment strategy to cases

The next leadership question

Not just: should we use cloud?
But: where should this workload live?

Context matters

- speed
- control
- compliance
- continuity

Deployment strategy is like storing valuables

Daily items, lockers, backups — not everything belongs in one place.

Same for workloads

different access
different protection
different speed

Opening power question

For a critical system, what matters most first?

Speed

Cost

Control

Compliance

Continuity

Session journey

1. Why strategy matters
2. Four models
3. Compliance lens
4. ERP vs innovation
5. Case discussion

Why deployment strategy matters

Poor decision

risk

cost escalation

complexity

Strong decision

governance

agility

resilience

CXO lens

value

control

business fit

Interactive question

Should a critical system move fast or move safely?

Expected answer

it depends

Four deployment models

Public
speed
scale
innovation

Private
control
isolation
sensitive data

Hybrid
balance
legacy + new

Multi-cloud
choice
flexibility

One-line executive summary

Public
move fast and scale quickly

Private
keep tighter control

Hybrid
balance old and new

Multi-cloud
use strengths by provider

Public cloud

Best when speed, scale, and innovation matter

Use cases

campaigns | analytics | AI pilots

Value

fast go-live | elastic scale

Watch-out

govern cost and access

Public cloud humour

Public cloud is like a buffet.

Options are many.

Bills need discipline.

Leadership message

freedom needs governance

Private cloud

Best when control, isolation, and sensitive data matter

Use cases

BFSI | regulated workloads

Value

control | governance comfort

Watch-out

higher cost | less elasticity

Private cloud humour

Private conference room

controlled

comfortable

reserved

But not for every meeting

control has cost

Hybrid cloud

Controlled core
ERP
sensitive workloads

Hybrid bridge
integration
phased modernization

Innovation edge
apps
analytics
AI

Best when the enterprise needs balance

Hybrid cloud use cases

ERP + analytics

stable core

fast insights

Plant + dashboard

local systems

cloud visibility

Core + customer app

controlled data

scalable front-end

Hybrid cloud humour

**Some things remain traditional.
Some things become modern.
Success is making both work peacefully.**

Multi-cloud

Why use it?

provider strengths

flexibility

resilience

less lock-in

Multi-cloud question

Are we choosing multiple clouds by strategy — or by accident?

Watch-outs

governance
skills
cost tracking

Multi-cloud humour

Five TV remotes

technically everything works

But who controls what?

governance is the remote

Executive comparison

Dimension	Public	Private	Hybrid	Multi-cloud
Speed	High	Medium	Balanced	Medium
Control	Lower	High	Balanced	Variable
Compliance	Moderate	High	Strong	Design-led
Complexity	Medium	Medium	High	High

Compliance and governance lens

- Data sensitivity
- Regulation
- Audit
- Access control
- BCP / DR

Leadership questions

1. What data is involved?
2. How sensitive is it?
3. Which regulations apply?
4. Who needs access?
5. What if service fails?

Compliance humour

**Compliance is like a seat belt.
You appreciate it when something unexpected happens.**

ERP vs innovation platforms

Core ERP

stability
governance
integration
low disruption

Innovation platforms

speed
experimentation
analytics
AI

ERP vs innovation humour

ERP is the family accountant. Innovation is the startup founder.

Both matter

but not with the same rules

Case discussion

Select the deployment strategy

Apply the model to a real business scenario.

Scenario options

- ERP modernization
- Customer analytics
- Plant monitoring
- Financial data
- AI experimentation

Case discussion flow

1. Understand workload
2. Assess risk
3. Assess speed
4. Assess integration
5. Recommend model

Group presentation format

Scenario

selected workload

Model

Public / Private / Hybrid / Multi-cloud

Value

business benefit

Risk

what to manage

Example deployment choices

ERP modernization

Hybrid

modernize without disruption

Customer analytics

Public / Multi-cloud

faster insights

Financial data

Private / Hybrid

control and audit

Mini poll

Which factor should influence deployment strategy the most?

- Speed
- Cost
- Data sensitivity
- Criticality
- Vendor flexibility
- Innovation

Key takeaways

Public

speed and scale

Private

control

Hybrid / Multi-cloud

balance and flexibility

Session outcome

Leaders can now discuss cloud architecture through a strategic business lens.

Capability built

workload fit
risk awareness
deployment logic

Session close

Deployment strategy is not where technology is hosted.
It is where business value, risk, control, and agility are balanced.

Transition to Session 5 | Cloud Economics

Thank You

Let’s continue the cloud, AI and digital transformation journey.
